Measure the wet film thickness with an appropriate gauge. Dry for 24 hours at standard conditions. Use a BYK-Gardner "Color Guide" Spectrophotometer to measure the opacity according to the manufacturer's instructions. Calibrate the spectrophotometer according to the manufacturer's instructions using 2 Degree Observer/Illuminant "C" measurement conditions, and the (Y, x, y) color system.

Prepare samples of the white and yellow paints as described in above sections. Alternately expose the samples to eight (8) hours of UV exposure at 60 Degrees C, followed by four (4) hours condensate exposure at 50 Degrees C - in a QUV Accelerated Weathering Tester. Type UVA-340 bulbs are used at an irradiance level of 0.77 watts per square meter per nm. at 340 nm., as measured at the sample surface during the UV cycle. After 300 hours total exposure the paint samples shall meet the requirements below.

White - Yellowness Index after weathering, maximum 12
Yellow - Must pass Yellow Color test after weathering

Scrub Resistance:

| | <u>White</u> | <u>Yellow</u> |
|-----------------|--------------|---------------|
| Cycles, minimum | 800 | 800 |

Follow the procedure in ASTM D2486. Prepare a panel using an appropriate bird doctor blade that will produce a uniform dry film thickness of paint between 80 and 100. Dry the panel for 7 days at standard conditions. The panel shall require more than 800 cycles to remove the paint film in one continuous line across the width of the shimmed area.

Lead:

| | <u>White</u> | <u>Yellow</u> |
|--|--------------|---------------|
| mg/kg in dried paint maximum, ASTM D3335 | 20 | 20 |

The white and yellow paints shall be free of lead, mercury, cadmium, hexavalent chromium and other toxic heavy metals as defined by the United States Environmental Protection Agency.

| | <u>White</u> | <u>Yellow</u> |
|---|--------------|---------------|
| Chromium, mg/kg in dried paint, maximum, ASTM D3718 | 5 | 5 |

Thick Application Cracking Resistance:

| | <u>White</u> | <u>Yellow</u> |
|--|--------------|---------------|
| | Pass | Pass |

On a black-white Leneta chart, Form 2C-Opacity, draw down a stripe of the paint 75 mm wide and at least 150 mm long and having a 1530 ±130 wet film thickness. Allow the paint to dry for 48 hours at standard conditions on a horizontal surface. After 48 hours the paint film shall not contain any cracks.

pH:

| | <u>White</u> | <u>Yellow</u> |
|------------------|--------------|---------------|
| Minimum ASTM E70 | 9.9 | 9.9 |

Acrylic Polymer Emulsion:

The paint shall consist of a commercial high build acrylic polymer emulsions.

Reflective Media:

The reflective media shall be made up of reflective bonded core elements and glass beads for drop on application and shall conform to the following requirements.

Bonded Core Reflective Elements:

The bonded core reflective elements shall contain either clear or yellow tinted microcrystalline ceramic beads bonded to the outer surface.

Index of Refraction - All microcrystalline ceramic beads bonded to reflective elements shall have a minimum index of refraction of 1.8 when tested using the liquid oil immersion method.

Testing Procedure - Refractive index of beads by liquid immersion

Equipment Required:

- Microscope (minimum 100X magnification)
- Light Source - preferably sodium light or other monochromatic source, but not absolutely essential
- Refractive Index Liquids
- Microscope Slide and Slide Cover
- Mortar and Pestle

Procedure:

- Using the mortar and pestle, crush a few representative beads and place a few of these crushed particles on a microscope slide.
- Place a drop of refractive index liquid, with an index as close to that of the crushed particles as can be estimated, on the particles.
- Cover the slide with a microscope slide cover and view the crushed particles by transmitted light normal to the slide surface (illuminated from the bottom).
- Adjust the microscope mirror to allow a minimum light intensity for viewing. This is particularly important if sodium light is not used.
- Bring a relatively flat and transparent particle into focus.
- By slightly raising and lowering the objective (microscope tube), look for one or both of the following:

Becke Line - This light line will appear to move either into the particle or away from it. In general, if the objective is raised, the line will move toward the material of higher refractive index; if the objective is lowered, the line will move toward the material of lower index.

Variation in Particle Brightness

When raising the objective from a sharp focus, the particle will appear to get brighter or darker than the surrounding field. If it becomes brighter, the particles have a higher refractive index than the liquid. If it becomes darker, the glass has a lower refractive index than the liquid. In both cases, the opposite will be true if the objective is lowered.

This test can be used to confirm that the beads are above or below a specified index. It can also be used to give an accurate determination of the index (+ or - 0.001). This is done by using several refractive index liquids until a match or near match of indices occurs. The index of the glass will equal that of the liquid when no Becke line and no variation in bead brightness is observed.

The size and quality of the beads shall be such that the performance requirements for the retro-reflective material shall be met.

Acid Resistance

A sample of microcrystalline ceramic reflective elements supplied by the manufacturer, shall show resistance to corrosion of their surface after exposure to a 1% solution (by weight) of sulfuric acid. The 1% acid solution shall be made by adding 5.7cc of concentrated acid into 100cc of distilled water. CAUTION: Always add the concentrated acid in the water, not the reverse.

Place 10g of the beads in a 100ml beaker and cover with 30-40 ml of the 1 weight percent sulfuric acid solution. Cover the beaker to prevent evaporation and allow the sample to be exposed for 24 hours under these conditions. Then decant the acid solution and rinse the sample with fresh DI water followed by drying the sample in 150 Degree F (66 Degree C) oven for approximately 15 minutes or until the sample is dry. Microscopic examination (20X) shall show not more than 15% of the beads having the formation of a very distinct opaque white (corroded) layer on their entire surface to be classified as passing the acid resistance test.

Glass Beads:

The required glass beads shall have an index of refraction of 1.5 when tested by the immersion method at 25 Degrees C (77 Degrees F). The glass beads shall be surface treated for optimal performance with waterborne traffic marking paint. The glass beads shall have a minimum of 70% Rounds as measured according to ASTM D1155. The surface of the glass beads shall be free of pits and scratches. The glass beads retained on the #40 U.S. Mesh Sieve (425 microns) shall have minimum crush strength of 30 pounds in accordance with ASTM D 1213. The glass beads shall conform to either of the following gradation specifications.

P40 or equivalent

| U.S. Standard Sieve Number | Size of Microns | % Passing by Weight |
|----------------------------|-----------------|---------------------|
| 20 | 850 | 90 - 97 |

| 40 | 425 | 15 - 45 |
| 50 | 300 | 0 - 15 |

| 50 | 300 | 15 - 35 |
| 80 | 180 | - |
| 100 | 150 | 0 - 5 |

Track-free shall be considered as the condition where no visual deposition of the traffic paint marking to the pavement surface is observed when viewed from a distance of fifty (50) feet, after a free-rolling traveling vehicle's tires have passed over the line. The track-free time shall not increase substantially with decreasing temperature.

COLOR AFTER APPLICATION

The equipment shall be capable of producing markings that meet the specifications contained herein using the materials specified in the appropriate section.

1. The equipment shall be mobile, truck mounted and self-contained pavement marking machine.
2. The equipment shall be designed to maintain a uniform rate of speed at increasing or decreasing road grades.
3. The equipment shall be capable of air blasting the pavement, spraying the traffic marking paint and immediately dropping the reflective elements and glass beads in a single pass at speeds up to eight (8) mph.
4. If using equipment containing a heat exchanger, it shall be capable of heating and maintaining the heated temperature of the liquid not exceeding 100 Degree F in the heat exchanger and 100 Degree F at the spray nozzle to enable proper spraying of the traffic marking paint.

At any time throughout the duration of the project, the Contractor shall provide free access to his application equipment for inspection by the Engineer, his authorized representative, or a materials representative.

APPLICATION CONDITIONS

1. **Moisture:** The marking shall only be applied during conditions of dry weather and when the pavement surface is dry and free of moisture.
2. **Air Temperature and Humidity:** The marking shall only be applied when road and air temperatures are above 60 Degrees F under humidity conditions of 85% or less.
3. **Surface Preparation:** Marking operations shall not begin until applicable surface preparation work is completed and approved by the Engineer.
 - a. Prior to applying the markings, the Contractor shall remove all curing compounds on new Portland cement concrete surfaces.

- b. Prior to applying the markings, the Contractor shall remove all dirt, sand, dust, oil, grease and any other contaminants from the road surface.
4. **Dimensions:** The reflectorized pavement markings shall be placed only on properly prepared surfaces and at the widths and patterns as designated on the contract plans. The markings shall be applied in accordance with the "Manual on Uniform Traffic Control Devices" and in accordance to the Engineer's plans.
5. **Other Restrictions:** The Engineer and/or Contractor shall determine further restrictions and requirements of weather and pavement conditions necessary to meet all other application specifications and produce markings that perform to the satisfaction of the Engineer. If the pavement surface contains heavy fines or very large aggregate used in open grade friction course or stone matrix asphalt mixes it may require additional surface preparation prior to application of liquid traffic marking system.
6. **Liquid Thickness:** The liquid paint shall be applied at 25 mil \pm 2 mil wet film thickness.
7. **Reflective Media Application:** The specified reflective media shall be dropped at rates to achieve the following coating weights:

5. Inspection and Testing

During the application of the traffic paint, the Engineer may request the following tests to verify application to the parameters required in this specification.

1. **Liquid Thickness:** During appropriate locations along the alignment of the project site, the Engineer may obtain a sample of the wet traffic paint applied onto a test panel of aluminum for the purposes of checking for proper wet traffic paint film thickness. The traffic paint shall be applied without reflective elements or glass beads. Upon drying of the liquid material, the dry thickness shall be verified by the Engineer to meet the requirements of Section "Application Conditions - Liquid Thickness" in this specification. The Contractor shall provide to the Engineer the application speed of the equipment during the time of the sample.
2. **Reflective Media:** When required by the Engineer, the Contractor shall demonstrate to the Engineer the proper calibration of reflective elements and glass beads compared with the manufacturer's requirement. The calibration shall be conducted with a graduated cylinder or other similar device. Reflective elements or glass beads shall be collected from the reflective elements and glass bead guns for a timed period. The volume of the reflective elements and glass beads collected shall be measured and compared with the manufacturers requirements.
3. **Application Panel:** The Contractor shall provide to the Engineer at least one dry sample coated on aluminum, with typical dried liquid paint and reflective media applied onto the surface. This sample will serve as a record of the project application conditions and settings.

6. Contract Units, Basis for Payment

1. Retroreflective markings will be paid for at the contract unit price (in gallons), which shall be full compensation for cleaning and preparing the pavement surface, for furnishing and placing all materials, and for all materials, labor, tools, equipment, and incidentals necessary to complete the work.
2. When materials are found to be non-conforming under these Specifications, the Contractor shall bear full responsibility for all repair work and associated costs, including purchase of replacement materials at no cost.
3. When the fault of non-conformance with the specification is indeterminate or in dispute, the materials supplier shall provide replacement materials and the Contractor shall repair the markings, both at no cost to the Engineer and/or County.

Re: Award of Striping of County Roads and Various City Streets

On March 20, 2012, two (2) bids were opened for the striping of Sarpy County Roads and various city streets including roads within Cass County and the Cities of Bellevue, Papillion, LaVista, Ralston and Gretna. The bids were reviewed by the Public Works Department and Purchasing.

After review, it is recommended that the low base bid of Vogel Traffic Services, Inc. of \$16.87 per gallon for County roads and \$19.87 per gallon for City roads be accepted. The current contract with Vogel Traffic Services has a price of \$14.33 per gallon for County roads and \$19.33 per gallon for City roads. This would be about a 15% price increase for the County. The Cities are under no obligation to use the selected contractor.
